

Introduction

As blockchain technology evolves and it is becoming clear it has potential long-term value, we are striving to make it more accessible to the public by decentralizing cryptocurrency mining and offering anyone to have a fair chance of being involved in it.

How does it work

By raising funds, we will be able to build infrastructure for various activities, including cryptocurrency mining, in which stakers can directly participate in a decentralized manner. There will be strategic decisions carried out by the team as to which cryptocurrencies will be mined at what time and with which equipment, considering the market conditions, equipment, and energy costs. Users will be able to stake their tokens and thus join the staking pool. The higher amount the user stakes, the bigger share of the staking pool will the user own.

Why should you stake?

Mining by staking PRZ tokens - as opposed to solo mining - will be much more flexible, as one does not have to worry about additional costs of equipment and energy and can enjoy a low entry point in the form of staking, as well as simple process of getting out of staking.

In the future, the project will consider diversifying in other assets, such as NFTs, luxury items and art to achieve more balanced and safer asset portfolio and to ensure better liquidity.

Tokenomics

PRZ is the utility token of the Prozium protocol running on Binance Smart Chain. By staking, the user will be able to join the staking pool, which will receive rewards in the form of PRZ tokens.

Initial supply: 100 000 000 PRZ

Staking

Users will be able to stake their PRZ tokens for different staking periods. The longer the staking period, the higher rewards in the form of PRZ. By unstaking early, principal will be penalized in a linear matter (day 1 of staking = 100 % penalization, final day of staking = 0 % penalization), and interest will be penalized completely. See the table below for closely explained lock-up period.

Staking period	Daily PRZ interest (%)	Interest earned (%)	APR (%)
180 days	0.025	4.5	9
360 days	0.05	18	18
720 days	0,075	54	27

Penalization will be carried out by burning the penalized amount, which will lead to higher scarcity (lower circulating amount) of PRZ token.
